

Smart Urban Parking System Report

Project Overview:

This project is a web-based Smart Urban Parking System designed to help users find and reserve parking spaces efficiently. It follows the MVC architecture and includes features such as booking management, routing, and database integration.

Key Features:

- User-friendly interface
- Parking slot reservation
- Database integration using MySQL
- MVC architecture (Models, Views, Controllers)
- Error handling (404 pages)

Conclusion:

The system demonstrates how modern web applications can efficiently manage real-world problems such as urban parking. Future improvements may include real-time updates and mobile integration.
